

Maureen Obiekwe

QA Engineer | Manual & Exploratory Testing | API & Web Application Testing

✉ obiekwekosi32@gmail.com | ☎ +234 9158765202 | 📍 Lagos, Nigeria

PROFESSIONAL SUMMARY

Detail-oriented QA Engineer with hands-on experience testing peer-to-peer marketplace platforms, business advisory web products, and full-stack web applications across web and mobile. Skilled in writing structured test cases with full requirements traceability, executing functional, regression, exploratory, and API testing, and logging clear, reproducible defects with severity and priority. Comfortable working directly with developers, PMs, and designers in Agile/Scrum environments to surface risk early, validate fixes, and protect the user experience before release.

PROFESSIONAL EXPERIENCE

SharePact | Quality Assurance Engineer Jan 2025 – Present

Remote

Tools: Postman · Chrome DevTools · Firefox · ClickUp · Jira · Google Sheets · TestRail · Jam.dev · Android Studio Emulator · Xcode Simulator · BrowserStack · curl · SQL

- Owned end-to-end QA for a peer-to-peer rental marketplace with listings across Sports, Outdoors, Tools, Electronics, Kitchen, Clothing, and Party & Events, covering web, iOS, and Android.
- Built and maintained a test case repository in Google Sheets with full traceability between requirement IDs, ClickUp tickets, and test runs across sign-up, ID verification, listing creation, search and geolocation, rental booking, payment, and insurance flows.
- Caught a P0 defect in the rental checkout flow where the booking confirmation could be triggered before the payment status returned, preventing released-but-unpaid bookings from reaching production.
- Tested ID verification and KYC flows for renters and owners, validating edge cases on document upload (file size limits, unsupported formats, expired IDs) and flagging anti-enumeration gaps on the login and forgot-password endpoints.
- Ran API testing in Postman against listing, booking, messaging, and payment endpoints — asserting status codes, response shape, error handling, and rate limiting — and documented contract mismatches between frontend and backend for the dev team.
- Verified the multi-language experience (English, French, Italian, Dutch, German) across the landing page and core flows, surfacing layout breaks, untranslated strings, and currency formatting issues at 375px, 768px, and 1440px viewports.
- Reduced post-release defect leakage by writing regression suites tied to each milestone and re-running them after every fix; bugs were linked to parent tickets with reproduction steps, evidence (Jam.dev recordings, screenshots), severity, and priority.
- Carried out exploratory testing on the in-app messaging between renter and owner, the cancellation flow, the insurance claim path, and the host payout flow, and logged 30+ usability and validation issues that fed into UX iteration.

Owens and Xley Consults | Quality Assurance Engineer Jun 2022 – Dec 2023

Lagos, Nigeria (Hybrid)

Tools: Postman · Google Sheets · ClickUp · Trello · Chrome DevTools · WordPress · Lighthouse · GTmetrix · Slack · Zoom

- Tested client-facing web products and internal tools for a Lagos-based business consulting firm serving SMEs and entrepreneurs across recruitment, advisory, and business development services.
- Validated the recruitment portal end-to-end — job listing submission, candidate application forms, CV uploads, and email confirmations — and flagged validation gaps on email fields, phone number formats, and required-field bypasses.
- Audited the contact, lead-capture, and consultation booking forms on the company website, surfacing missing client-side validation, weak error messaging, and form submissions that succeeded with empty required fields.
- Worked alongside the business analyst team to QA client-facing deliverables (business plans, pitch decks, advisory reports) before sign-off, catching formatting inconsistencies, broken links, and outdated figures before they reached the client.
- Improved internal QA discipline by introducing a structured bug report template (steps to reproduce, environment, severity, priority, evidence) in ClickUp, replacing ad-hoc Slack reports.
- Ran cross-browser checks on Chrome and Firefox and responsive checks across mobile, tablet, and desktop viewports, raising a backlog of UI/UX defects (alignment, spacing, font inconsistencies, button states) that fed into a site refresh.
- Tested page performance using Lighthouse and GTmetrix and flagged regressions on image sizes, render-blocking resources, and Core Web Vitals after every content update.

EDUCATION

B.Sc. [Software Development] [2022-2025]

[International University of Applied Science] · [Germany]

VOLUNTEER EXPERIENCE

QA Engineer · Anvila (HNG Internship) [March 2026 - present]

Remote

Tools: Postman · ClickUp · Google Sheets · Chrome DevTools · Firefox · curl · Jam.dev · SendGrid · Stripe (Test Mode) · GitHub · Slack

- QA Engineer on Anvila, a platform that turns plain-English descriptions into structured, GitHub-ready AI agent setup packages (identity.md, soul.md, dna.md, heartbeat.md, README, and matched skills) with public registry browsing and a paid private-package tier via Stripe.
- Authored the MVP Test Plan covering 6 milestones: Authentication & Onboarding, Agent Generation Pipeline, GitHub Auto-Publishing, Registry & Explore Page, Privacy Tier with Stripe payments, and Skill Registry integration with skills.sh and OpenClaw.
- Wrote and executed 92 functional and security test cases for the auth flow: sign-up, sign-in, email verification, password reset, Google and GitHub OAuth, JWT session management, and route protection — each mapped to a requirement ID (AUTH-REQ-001 to 092) and a ClickUp ticket for full traceability.
- Surfaced and flagged a release-blocking ambiguity between the TRD and ticket AC on cross-provider OAuth (auto-link vs 409 conflict) before testing began, preventing wasted QA cycles on conflicting expected results.
- Ran anti-enumeration security testing with curl timing comparisons on login, forgot-password, and resend-verification endpoints to confirm response times for existing vs non-existing emails stayed within a safe delta, protecting against email enumeration via timing attacks.

- Verified JWT cookie security — HttpOnly, Secure, SameSite=Strict — and confirmed route protection so unauthenticated users could not access /generate, /dashboard, or any protected route, even via direct URL entry or refresh.
- Tested the agent generation pipeline end-to-end: input validation, the 3-round LLM clarification cap, structured markdown file output, skill matching from external registries (2–6 skills per agent), rate limiting (5 requests/min/user), and graceful 422 handling on OpenAI parse failures.
- Validated GitHub auto-publishing — repo naming conventions (agent-{slug} for public, agent-{slug}-prv-{hash8} for private), commit completeness, topic tagging, and error codes (401, 402 for unpaid private, 403, 404, 409, 502) — plus confirmed the service account PAT was correctly scoped to the AgentForge org.
- Completed the Stage 6 exploratory testing task by submitting 10+ functional bugs, 5+ UI/UX defects, and 5+ data/validation defects with reproducible steps, severity, priority, and Jam.dev evidence, plus a written exploratory notes and risk-prioritisation report.
- Maintained a defect classification framework (P0–P3) with concrete Anvila examples — e.g., JWT leaking to localStorage as P0, anti-enumeration failures as P1, missing loading spinners as P2 — so triage between QA, dev, and PM stayed consistent.

CORE COMPETENCIES

Manual Testing · Exploratory Testing · Functional & Regression Testing · Negative & Boundary Testing · API Testing (Postman) · Test Case Design · Requirements Traceability · Defect Reporting & Triage · Severity & Priority Assessment · Cross-Browser & Responsive Testing · Mobile Testing (iOS / Android) · Performance Spot-Checks (Lighthouse, GTmetrix) · Agile / Scrum · Stakeholder Communication · Risk-Based QA · Test Planning & Documentation · CI Automation
